Example of a Trust Game

- Binary trust game

- Player A can choose “S” in which both players receive $10, or she can choose “C” in which Player B is given the opportunity to determine final payoffs.

- If given the opportunity, Player B can then choose “E” in which Player A receives $5 and Player B receives $25, or he can choose “R” in which both players receive $15.

- Player A’s decision is often viewed as her level of trust, and Player B’s decision as his level of trustworthiness.
